Mr. Rob Sitterley AR-TX REDI 2900 Saint Michael Drive 5th Floor Texarkana, Texas 75503

ECS Project No. 51:2000

Reference: Wetland Delineation – East Texas Logistics Facility – Interstate 30 and Spur-86, New Boston, Bowie County, Texas 75570

Dear Mr. Sitterley:

ECS Southwest, LLP (ECS) is pleased to submit this report of the Wetland Delineation services for the above-referenced site. ECS' services were provided in general accordance with ECS Proposal No. 51:1816 authorized on October 20, 2020 and generally meet the requirements of the 1987 U.S. Army Corps of Engineers (USACE) Wetlands Delineation Manual, and the Regional Supplement to the USACE Wetland Delineation Manual: Atlantic and Gulf Coastal Plain, Version 2.0 date March 2010. *Based on our wetland delineation, it is ECS's opinion that potentially jurisdictional Waters of the U.S. (WOUS) are present on the Project site.* However, final authority in determining jurisdiction of features, including significant nexus decisions, rests with the U.S. Army Corps of Engineers.

Upon your request, we will contact the USACE to schedule a field meeting to conduct a Waters of the U.S. (WOUS) boundary confirmation and jurisdictional determination. This process takes anywhere from a few weeks to six (6) months, depending on the availability of USACE personnel. After the boundaries of the waters of the U.S. have been confirmed by the USACE, we suggest that the areas be surveyed for future planning purposes and be submitted to the USACE as a final record. If any potential impacts are proposed, we can assist you with permitting options and support to complete the process.

ECS would like to thank AR-TX REDI for the opportunity to provide you with this Wetland Delineation. We look forward to assisting you further with this project and other environmental concerns you may have. If you have any questions, please feel free to contact us at any time at 512-837-8005.

Sincerely,

ECS SOUTHWEST, LLP

May 27

ECS Project No. 51:2000

Wetland Delineation – East Texas Logistics Facility – Interstate 30 and Spur 86, Reference: New Boston, Bowie County, Texas 75570

1.0 INTRODUCTION

The purpose of this Wetland Delineation is to review a site associated with a proposed logistics center outside of New Boston in Bowie County, Texas, hereafter referred to as the Project, for jurisdictional Waters of the U.S (WOUS) within the Project study area.

Wetlands are defined by the United States Army Corps of Engineers (USACE) and the United States Environmental Protection Agency (EPA) as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and under normal circumstances, do support a prevalence of vegetation typically adapted for life in saturated soil conditions." In order for an area to be classified as wetland, hydrophytic vegetation, hydric soils. and wetland hydrology indicators must be present.

2.0 PROPERTY DESCRIPTION

The Client is proposing to develop two parcels of land totaling approximately 850 acres that are currently used for timber production.

A map of the Project is included as Appendix A, Figure 1.

3.0 METHODOLOGY

This Wetland Delineation is based on ECS' professional judgment and application of the technical criteria presented in the 1987 USACE Wetlands Delineation Manual (USACE 1987), and on the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Atlantic and Gulf Coastal Plain Region Version 2.0 dated March 2010 (USACE 2010).

ECS completed the following tasks to identify and delineate potentially jurisdictional WOUS boundaries onsite:

3.1 Literature Review

ECS wetland scientists reviewed the U.S. Geological Survey (USGS) Topographic Map Hooks, Texas Quadrangle 2019, U.S. Department of Agriculture Natural Resource Conservation Service (USDA-NRCS) Soil Survey of Bowie County, the USDA NRCS 2015 National Hydric Soils List for Bowie County, the Federal Emergency Management Agency (FEMA) Floodplain Mapping (Panel 48037C0305D), U.S. Fish & Wildlife Service (USFWS) National Wetlands Inventory (NWI) Wetlands Mapper, available aerial photographs to identify potentially jurisdictional Waters of the U.S. (i.e., streams, wetlands, natural ponds, lakes), and available watershed information.

3.2 Methodology for Field Investigation

Wetland boundaries were delineated using the routine onsite determination method described in the USACE Manual and Regional Supplement, in conjunction with the Great Plains 2016 Regional Wetland Plant List and the USDA Soil Survey.

ECS performed onsite wetland delineations as described above. First, site hydrology was observed and the plant community within the data plot was characterized. The dominant plant species within each community were then identified, and it was determined whether or not hydrophytic (wetland) plants dominated the plant community. The USFWS has defined five (5) wetland plant indicator categories including:

Obligate wetland (OBL) – has >99% probability of occurring in wetlands Facultative wetland (FACW) – has 66% to 99% chance of occurring in wetlands Facultative (FAC) – has 33% to 66% chance of occurring in wetlands Facultative upland (FACU) – has 1 to 33% chance of occurring in wetlands Upland (UPL) – has <1% chance of occurring in wetlands No Indicator (NI) – no wetland indicator for the specified species, considered UPL Plants identified as OBL, FACW, or FAC are considered wetland plants (or hydrophytes) by USACE.

In areas determined to have hydrophytic vegetation and potential wetland hydrology, an approximately 16-24 inch deep hand auger soil boring or shovel test pit was completed to determine if hydric soils were present. The soil boring was also inspected to determine if indicators of wetland hydrology (inundation, soil saturation, etc.) were present.

Once an area is determined to be a potential wetland, further testing was performed to locate the wetland/upland (non-wetland) boundary. A second soil data point was completed in the upland area to document non-wetland conditions. Potential wetland boundaries were marked with consecutively numbered surveyor's ribbon flags.

Data forms specified in the Regional Supplement were completed for each potential wetland and non-wetland soil data point location. The data forms recorded the vegetation, soils, and hydrology observations used in making the potential wetland determinations.

Pedestrian field reconnaissance was performed by ECS scientists on November 3-7, 2020. Field investigations compared the reviewed background data to existing conditions and determined the current extent of Waters of the U.S. on the Project. A Trimble Geo 7X was utilized to record all field data. The Trimble Geo 7X is a handheld Global Navigation Satellite System (GNSS) capable of sub-meter accuracy data collection. Waypoints were taken of all data points. Wetland and stream field notes were recorded on the appropriate regional supplement wetland data sheets. Following the field investigation, the GNSS data was imported into Google Earth Pro. The collected waypoint data was used to interpret and develop polygon boundaries for all stream and wetland features.

3.3 Methodology for Delineating Streams

During the field investigation for potential wetlands, ECS identified streams onsite that would be considered jurisdictional by state and federal regulatory agencies. ECS used field indicators such as flow, substrate composition, presence/absence of defined bed and banks, origin of hydrologic source, presence/absence of vegetation in the stream channel, and composition and relative abundance of resident benthic macroinvertebrates to classify onsite streams into three stream types: ephemeral, intermittent, and perennial.

4.0 PROJECT SUMMARY AND SETTING

Hydrology, topography, vegetation, and soils within the Project boundaries are detailed below.

4.1 Topography

According to the USGS topographic map Hooks, TX Quadrangle, elevation of the Project ranges from approximately 395 feet above mean sea level (msl) on the southern boundary of the Project, sloping to approximately 343 feet above msl on the northeastern corner. A local high point of approximately 385 feet amsl is also located on the northwestern corner of the Project. A topographic map of the Project is included as Appendix I, Figure 2.

4.2 Hydrology

One intermittent stream (Panther Creek) is mapped crossing the Project from southwest to northeast on the USGS Topographic map. Four streams are depicted on the NWI map (USFWS 2020) (Appendix II, Attachment 2). The streams are interrupted by palustrine forested wetlands but appear to consist of one stream flowing north along the eastern boundary of the Project, the previously noted stream flowing southwest to northeast through the Project (Panther Creek), and two streams flowing west to Panther Creek on the southern portion of the Project. Numerous palustrine forested wetlands are mapped on the Project, with the majority being on the northwestern portion.

The Project is located within the Barkman Creek watershed, identified as Hydrologic Unit Codes (HUC) 111401060604 (EPA 2020).

The majority of the Project is located outside of the 100-year floodplain (Zone X) with a swath of 100-year floodplain (Zone A) crossing the Project with Panther Creek from southwest to northeast (Appendix II, Attachment 3).

4.3 Vegetation

Vegetation observed during field reconnaissance included longleaf pine (*Pinus palustris*), water oak (*Quercus nigra*), pin oak (*Quercus palustris*), American hornbeam (*Carpinus caroliniana*), hackberry (*Celtis occidentalis*), American elm (*Ulmus americana*), eastern red cedar (*Juniperus virginiana*), slippery elm (*Ulmus rubra*), Brazilian bluewood (*Condalia hookeri*), buffalo nut (*Pyrularia pubera*), blackjack oak (*Quercus marilandica*), sweetgum (*Liquidambar styraciflua*), southern red oak (*Quercus falcata*), winged elm (*Ulmus alata*), osage orange (*Maclura pomifera*), eastern baccharis (*Baccharis halimifolia*), American beautyberry (*Callicarpa americana*), yellow nutsedge (*Cyperus esculentus*), .southern dewberry (*Rubus trivialis*), marsh seedbox (*Ludwigia palustris*), bermudagrass (*Cynodon dactylon*), Mexican primrose-willow (*Ludwigia octovalvis*), torpedo grass (*Panicum repens*), southern cattail (*Typha domingensis*), Indian woodoats (*Chasmanthium latifolium*), poison ivy (*Toxicodendron radicans*), white clover (*Trifolium repens*), tapered rosette grass (*Dichanthelium acuminatum*), needleleaf rosette grass (*Dichanthelium acuminatum*), and saw greenbrier (*Smilax bona-nox*).

4.4 Soils

Three (3) soil units (Table 1) are located within the Project boundaries (NRCS 2020). Hydric soils are defined as soils that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part. The soil units found on the Project are listed as hydric or include hydric minor components in Bowie County (NRCS 2020) (Appendix II, Attachment 1).

Map Unit Symbol	Map Unit Name	Hydric Soil	Data Point
1	Adaton-Muskogee complex	Yes	DP-3, DP-5, DP-6, DP-7, DP-8, DP-9, DP-11, DP-12, UDP-1, UDP-2, UDP-3, WDP-1, WDP-2, WDP-2, WDP-3
4	Annona loam, 1 to 3 percent slopes	No (Minor components)	N/A
36	Sawyer silt loam, 0 to 3 percent slopes	No (Minor components)	DP-1, DP-2, DP-4, DP-10, DP-13

Table 1: Soil Units within the Project Boundaries

4.5 Observations

ECS conducted the field reconnaissance on November 3-7, 2020. At the time of site reconnaissance, the Project consisted of approximately 850 acres of timber land with approximately half of the northern portion and one third of the southern portion clear cut.

ECS personnel sampled nineteen (19) data points on the Project. Data points that indicated a wetland was present at the data point were labeled WDP (wetland data point) and a second data point was taken in an upland area (UDP) to delineate the differing communities. In total, ECS identified three (3) wetlands and three (3) streams on the Project.

Data point DP-1 was located in a recently clear cut area mapped by the NWI as a palustrine forested wetland. DP-1 was characterized by dark yellowish brown clayey sand soils which did not meet the requirements for a hydric soil. Hydrologic indicators were not observed in the vicinity of DP-1. Vegetation at DP-1 consisted of some standing hardwoods including buffalo nut, southern red oak, and osage orange with downed longleaf pine throughout the area. The trees were underlain by sparse eastern baccharis and winged elm with a herbaceous stratum consisting of grasses and thistle dominated by bermudagrass. Vegetation around DP-1 did not meet tests for hydrophytic vegetation.

Data point DP-2 was located in a recently clear cut area mapped by the NWI as a palustrine forested wetland. DP-2 was characterized by dark yellowish brown clayey sand soils with reddish yellow redox concentrations in the soil matrix which did not meet the requirements for a hydric soil. Hydrologic indicators were not observed in the vicinity of DP-2. Vegetation at DP-2 consisted of some standing hardwoods including winged elm and American hornbeam with downed longleaf pine throughout the area. The trees were underlain by eastern baccharis with a herbaceous stratum consisting of bermudagrass and juvenile eastern baccharis. Vegetation around DP-2 did not meet tests for hydrophytic vegetation.

Data point DP-3 was located in a recently clear cut area mapped by the NWI as a palustrine forested wetland. DP-3 was characterized by yellowish brown clayey sand soils which did not meet the requirements for a hydric soil. Hydrologic indicators were not observed in the vicinity of DP-3. Vegetation at DP-3 consisted of some standing hardwoods including slippery elm and sweetgum with downed longleaf pine throughout the area. The trees were underlain by sparse American beautyberry and winged elm with a herbaceous stratum consisting of bermudagrass, poison ivy, and juvenile American beautyberry. Vegetation around DP-3 did not meet tests for hydrophytic vegetation.

Data point DP-4 was located in a forested area mapped by the NWI as a palustrine forested wetland. DP-4 was characterized by dark yellowish brown clayey sand soils which did not meet the requirements for a hydric soil. Hydrologic indicators were not observed in the vicinity of DP-4. Vegetation at DP-4 was dominated by longleaf pine with some winged elm and sweetgum. The trees were underlain by sparse American beautyberry and winged elm with a herbaceous stratum consisting of Indian woodoats and poison ivy. Woody vines at DP-4 included poison ivy and greenbrier. Vegetation around DP-4 did meet the dominance test for hydrophytic vegetation.

Data point DP-5 was located in a forested area mapped by the NWI as a palustrine forested wetland. DP-5 was characterized by very dark gray silty clay soils with gray redox depletions in the soil matrix which did meet the requirements for a hydric soil. Hydrologic indicators were not observed in the vicinity of DP-5. Vegetation at DP-5 was dominated by longleaf pine with some sweetgum. The trees were underlain by sparse buffalo nut and hackberry saplings with a herbaceous stratum consisting of torpedo grass and greenbrier. Woody vines at DP-5 included consisted of poison ivy. Vegetation around DP-5 did not meet tests for hydrophytic vegetation.

Data point DP-6 was located in a forested area mapped by the NWI as a palustrine forested wetland. DP-6 was characterized by brown clayey sand soils which did not meet the requirements for a hydric soil. Hydrologic indicators were not observed in the vicinity of DP-6. Vegetation at DP-6 was dominated by longleaf pine with some buffalo nut. The trees were underlain by sparse buffalo nut saplings and winged elm and American beautyberry with a herbaceous stratum consisting of Indian woodoats and white clover. Woody vines at DP-6 included consisted of poison ivy and greenbrier. Vegetation around DP-6 did not meet tests for hydrophytic vegetation.

Data point DP-7 was located in a forested area mapped by the NWI as a palustrine forested wetland. DP-7 was characterized by brown clayey sand soils which did not meet the requirements for a hydric soil. Hydrologic indicators were not observed in the vicinity of DP-7. Vegetation at DP-7 was dominated by longleaf pine with some sweetgum. The trees were underlain by sparse water oak and sweetgum saplings with a herbaceous stratum consisting of Indian woodoats and yellow nutsedge. Woody vines at DP-7 included consisted of poison ivy. Vegetation around DP-7 did meet the dominance test for hydrophytic vegetation.

Data point DP-8 was located in a forested area mapped by the NWI as a palustrine forested wetland. DP-8 was characterized by very dark gray silty clay soils with strong brown redox concentrations in the soil matrix which did meet the requirements for a hydric soil. Hydrologic indicators were not observed in the vicinity of DP-8. Vegetation at DP-8 was dominated by longleaf pine with some sweetgum and hackberry. The trees were underlain by sparse southern red oak and sweetgum saplings with a herbaceous stratum consisting of Indian woodoats. Vegetation around DP-8 did not meet tests for hydrophytic vegetation.

Data point DP-9 was located in a forested area mapped by the NWI as a palustrine forested wetland. DP-9 was characterized by brown clayey sand soils which did not meet the requirements for a hydric soil. Hydrologic indicators were not observed in the vicinity of DP-9. Vegetation at DP-9 included hackberry, buffalo nut, and water oak. The trees were underlain by sparse hackberry saplings and American beautyberry with a herbaceous stratum consisting of Indian woodoats, bermudagrass, and poison ivy. Woody vines at DP-9 consisted of poison ivy. Vegetation around DP-9 did not meet tests for hydrophytic vegetation.

Data point DP-10 was located in a clearing mapped by the NWI as a non-wetland. DP-10 was characterized by brown clayey sand soils which did not meet the requirements for a hydric soil. Hydrologic indicators were not observed in the vicinity of DP-10. Vegetation at DP-10 included sparse longleaf pine. The trees were underlain by some American beautyberry and eastern baccharis with a herbaceous stratum consisting of bermudagrass, southern dewberry, greenbrier, and poison ivy. Vegetation around DP-10 did not meet tests for hydrophytic vegetation.

Data point DP-11 was located in a forested area mapped by the NWI as a palustrine forested wetland. DP-11 was characterized by brown clayey sand soils with reddish yellow redox concentrations in the soil matrix which did not meet the requirements for a hydric soil. Hydrologic indicators were not observed in the vicinity of DP-11. Vegetation at DP-11 consisted of longleaf pine. The trees were underlain by some American beautyberry and sparse eastern baccharis and winged elm with a herbaceous stratum consisting of bermudagrass, southern dewberry, and poison ivy. Woody vines at DP-11 consisted of greenbrier. Vegetation around DP-11 did not meet tests for hydrophytic vegetation.

Data point DP-12 was located in a forested area mapped by the NWI as a palustrine forested wetland. DP-12 was characterized by brown clayey sand soils with strong brown redox concentrations in the soil matrix which did not meet the requirements for a hydric soil. Hydrologic indicators were not observed in the vicinity of DP-12. Vegetation at DP-12 consisted of longleaf pine. The trees were underlain by some eastern baccharis with a herbaceous stratum consisting of tapered rosette grass and greenbrier. Vegetation around DP-12 did meet the dominance test for hydrophytic vegetation.

Data point DP-13 was located in a forested area mapped by the NWI as a palustrine forested wetland. DP-13 was characterized by brown clayey sand soils which did not meet the requirements for a hydric soil. Hydrologic indicators were not observed in the vicinity of DP-13. Vegetation at DP-13 consisted of longleaf pine. The trees were underlain by some American beautyberry and sparse winged elm with a herbaceous stratum consisting of Indian woodoats, yellow nutsedge, and greenbrier. Vegetation around DP-13 did meet the dominance test for hydrophytic vegetation.

Data points WDP-1 and UDP-1 were associated with Wetland 1; WDP-1 being located in the northwestern portion of the wetland near a power transmission line and UDP-1 being located southwest of WDP-1 in an area of similar elevation, but with a different plant community.

WDP-1 was characterized by a thin surficial layer of black silty clay underlain by gray silty clay soils with pale olive redox concentrations in the soil matrix which did meet the requirements for a hydric soil. Hydrologic indicators included approximately 3 inches of surface water, an algal mat, aquatic fauna (insects and tadpoles), and a hydrogen sulfide odor released from the soil. Vegetation at WDP-1 did not include trees or saplings. The herbaceous stratum consisted of southern cattail and Mexican primrose willow. Vegetation at WDP-1 met the dominance and prevalence tests for hydrophytic vegetation.

UDP-1 was characterized by a thin surficial layer of black silty clay underlain by gray silty clay with reddish yellow redox concentrations in the soil matrix which did meet the requirements for a hydric soil. Hydrologic indicators were not observed within the vicinity of UDP-1. Vegetation at UDP-1 consisted of thin longleaf pine with some sweetgum and American elm. The trees were underlain by sparse American beautyberry and slippery elm saplings with no herbaceous stratum. Vegetation at UDP-1 did not meet tests for hydrophytic vegetation.

Wetland 1 was a palustrine forested wetland. Although trees were not present at WDP-1 the wetland was characterized by black willow, slippery elm, and Brazilian bluewood at the margins and within the wetland. The wetland was ringed by Mexican primrose-willow and intermittent southern cattail which transitioned to yellow nutsedge before vegetation became consistent with upland flora; bermuda and other grasses in the easement to the north or deciduous hardwood forest floor in other directions. Though not noted at WDP-1, sphagnum moss hummocks were observed in the southeastern half of Wetland 1. Wetland 1 was located in the floodplain between Panther Creek (approximately 300 feet west) and an unnamed tributary (Stream 1) along the eastern boundary of the Project (approximately 200 feet east). Direct connectivity was not observed with the two streams however it appears that Wetland 1 is fed via a combination of overland sheet flow, elevated water table stemming from the streams, and flooding from the streams in periods of high precipitation. Due to its location, Wetland 1 appears to be a potential Water of the US due to its proximity and thus likelihood of a significant nexus with the nearby perennial and intermittent streams.

Data points WDP-2 and UDP-2 were associated with Wetland 2; WDP-2 being located in the northeastern portion of the wetland near the inflow from Panther Creek and UDP-2 being located northwest of WDP-2 in an area of higher elevation and a different plant community.

WDP-2 was characterized by gray silty clay soils with strong brown redox concentrations in the soil matrix which did meet the requirements for a hydric soil. Hydrologic indicators included approximately 2 inches of surface water, water-stained leaves, and a hydrogen sulfide odor released from the soil. Vegetation at WDP-2 consisted of overhanging hackberry, American hornbeam, and American elm with a lack of saplings or shrubs beneath. The herbaceous stratum consisted of sparse torpedo grass. Vegetation at WDP-2 met the dominance test for hydrophytic vegetation.

UDP-2 was characterized by brown clayey sand soils which did not meet the requirements for a hydric soil. Hydrologic indicators were not observed within the vicinity of UDP-2. Vegetation at UDP-2 consisted of hackberry with some American hornbeam and American elm with a lack of saplings or shrubs beneath. The herbaceous stratum consisted of sparse streambed bristlegrass, white clover, poison ivy, and greenbrier. Vegetation at UDP-2 did not meet tests for hydrophytic vegetation.

Wetland 2 was a palustrine forested wetland. However, the trees noted at WDP-2 were rooted in higher elevation areas and likely are not associated with the wetland. Sparse torpedo grass and marsh seedbox ringed the wetland. The wetland was located in an offshoot from the western bank of Panther Creek and was ringed with a sudden elevation rise of 1 to 3 feet. Direct connectivity with Panther Creek was observed at the northeastern end of Wetland 2 and the wetland appeared to be fed by water from the stream during periods of intermediate to high flow. Wetland 2 appears to be a potential Water of the US due to its observed connectivity with the perennial stream.

Data points WDP-3 and UDP-3 were associated with Wetland 3; WDP-3 being located in the northeastern portion of the wetland near the inflow from Panther Creek and UDP-3 being located south of WDP-3 in an area of higher elevation and a different plant community between Wetland 3 and Panther Creek.

WDP-3 was characterized by black clayey sand soils with a thin surficial layer of muck which did meet the requirements for a hydric soil. Hydrologic indicators included approximately 3 inches of surface water, aquatic fauna (insects, tadpoles, and small fish), and a thin muck surface. Vegetation at WDP-3 consisted of overhanging pin oak, American hornbeam, and water oak with a lack of saplings or shrubs beneath. The herbaceous stratum consisted of Mexican primrose-willow and sparse torpedo grass. Greenbrier was present in the overhanging trees. Vegetation at WDP-3 met the dominance and prevalence tests for hydrophytic vegetation.

UDP-3 was characterized by brown clayey sand soils which did not meet the requirements for a hydric soil. Hydrologic indicators were not observed within the vicinity of UDP-3. Vegetation at UDP-3 consisted of water oak and blackjack oak with sparse buffalo nut. The trees were underlain by water oak saplings with some American beautyberry. The herbaceous stratum consisted of Indian woodoats, bermudagrass, southern crabgrass, and greenbrier. Vegetation at UDP-3 met the dominance test for hydrophytic vegetation.

Wetland 3 was a palustrine forested wetland. However, the trees noted at WDP-3 were rooted in higher elevation areas and likely are not associated with the wetland. Mexican primrose-willow ringed the wetland with sparse torpedo grass on the margins. The wetland was located in an offshoot from the western bank of Panther Creek and was ringed with a sudden elevation rise of 1 to 2 feet. Direct connectivity with Panther Creek was observed at the northern end of Wetland 3 and the wetland appeared to be fed by water from the stream during periods of intermediate to high flow. Wetland 3 appears to be a potential Water of the US due to its observed connectivity with the perennial stream.

Three streams were observed on the Project. Two main streams were identified on the northern and southern portions of the Project with one smaller stream flowing into Panther Creek.

Stream 1 was observed flowing from the south adjoining Red River Army Depot, through a culvert under US Highway 82, north while meandering on and off the southern portion of the Project, through a culvert under Interstate 30, and north along the eastern boundary of the northern portion of the Project, eventually flowing into Panther Creek immediately north of the Project. Stream 1 was characterized by a defined bed and bank with riffles and runs. Stream 1 was incised up to 6 feet into underlying soil in parts of the southern portion, becoming shallower on the northern portion with banks being 1 to 3 three feet deep. Stream 1 appeared to be an intermittent feature and as such is considered a potential Water of the US due to its observed confluence with Panther Creek.

Panther Creek was observed flowing from the south adjoining Red River Army Depot, through a culvert under US Highway 82, northeast through the southern portion of the Project, through a culvert under Interstate 30, and northeast through the northern portion of the Project, eventually flowing onto the north adjoining property, doubling back and joining Stream 1 immediately north of the Project. Panther Creek was characterized by a defined bed and bank with riffles and runs. Panther Creek was incised 1 to 3 three feet into underlying soils throughout the Project. Two outlets were noted along Panther Creek on the northern portion of the Project, creating Wetlands 2 and 3. Panther Creek appeared to be a perennial feature and as such is considered a potential Water of the US due to its downstream confluence with Barkman Creek and the Red River.

Stream 2 was observed on the southern portion of the Project, beginning near a recently clear cut area. The NWI maps Stream 2 as originating in a palustrine forested wetland in the vicinity of DP-11 and DP-12, however evidence of the mapped wetland was not found. ECS personnel followed the course of Stream 2 from the point where banks became visible to its confluence with Panther Creek. At the time of site reconnaissance, Stream 2 was dry with no pools observed along its course. Stream 2 was characterized by a defined bed and bank incising 0.5 to 1 foot into underlying soils throughout its course. Based on the lack of flow given high recent precipitation and origination from overland flow to the east, ECS considers Stream 2 to be an ephemeral feature and thus not a potential Water of the US.

4.6 Jurisdictional Discussion

Stream 1 and Panther Creek appear to be natural tributaries with mapped connectivity to Barkman Creek and the Red River. ECS considers Stream 1 and Panther Creek to be Waters of the US based on their flow regime and connectivity with the Red River. Additionally, ECS considers the wetlands associated with Stream 1 and Panther Creek, Wetlands 1, 2, and 3 to be Waters of the US due to their observed connectivity or proximity to Stream 1 and Panther Creek. ECS does not consider Stream 2 to be a jurisdictional feature due to its ephemeral flow regime.

5.0 RESULTS

Based on our field investigation, potential Waters of the U.S. are located on the Project and may be subject to permitting under Section 404 of the Clean Water Act.

Table 2 summarizes the potential Waters of the U.S. Table 3 summarizes the potential wetland data points. A map of the results of the investigation is included in Appendix A, Figure 3.

Please note the final authority in determining jurisdiction of a water feature, including significant nexus decisions, rests with USACE.

Feature	Classification	Width at Ordinary High Water Mark	Depth at Ordinary High Water Mark	Length	Surface Area	Potentially Jurisdictional
Stream 1	Intermittent Tributary	3-10 ft.	1-6 ft.	11,872 ft.	N/A	Yes
Panther Creek	Perennial Tributary	4-20 ft.	1-3 ft.	21,594 ft.	N/A	Yes
Stream 2	Ephemeral Tributary	0.5-3 ft.	0.5 ft.	2,504 ft.	N/A	No
Wetland 1	PFO	N/A	N/A	N/A	0.41 acres	Yes
Wetland 2	PFO	N/A	N/A	N/A	590 sq. ft.	Yes
Wetland 3	PFO	N/A	N/A	N/A	624 sq. ft.	Yes

Table 3: Data Points Summary

6.0 SUMMARY

Based on our Wetland Delineation, potentially jurisdictional WOUS do appear to be present on the Project site. Final authority in determining jurisdiction of a water feature, including significant nexus decisions, rests with USACE.

The delineated WOUS boundaries are subject to change during the jurisdictional determination meeting with the USACE. ECS cannot guarantee that field conditions and/or WOUS boundaries will not change over time.

NRCS Soil Map Report

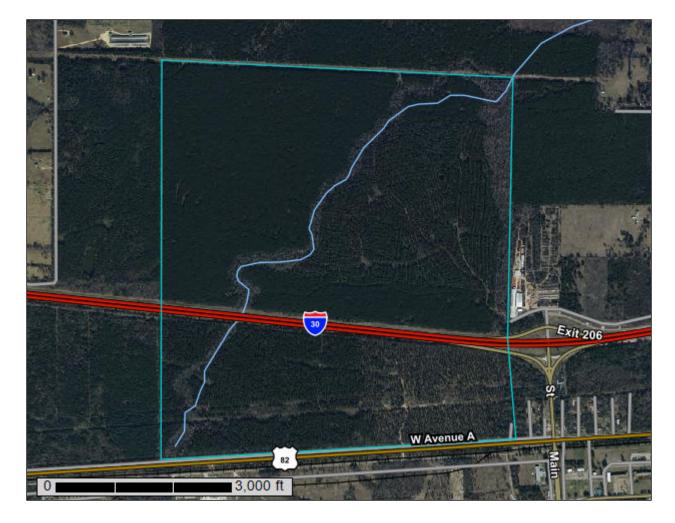

United States Department of Agriculture

Natural Resources Conservation Service A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for **Bowie County**, **Texas**

New Boston

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://www.nrcs.usda.gov/wps/portal/nrcs/main/soils/health/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (https://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://www.nrcs.usda.gov/wps/portal/nrcs/detail/soils/contactus/? cid=nrcs142p2_053951).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Web Soil Survey, the site for official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require

alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

How Soil Surveys Are Made

Soil surveys are made to provide information about the soils and miscellaneous areas in a specific area. They include a description of the soils and miscellaneous areas and their location on the landscape and tables that show soil properties and limitations affecting various uses. Soil scientists observed the steepness, length, and shape of the slopes; the general pattern of drainage; the kinds of crops and native plants; and the kinds of bedrock. They observed and described many soil profiles. A soil profile is the sequence of natural layers, or horizons, in a soil. The profile extends from the surface down into the unconsolidated material in which the soil formed or from the surface down to bedrock. The unconsolidated material is devoid of roots and other living organisms and has not been changed by other biological activity.

Currently, soils are mapped according to the boundaries of major land resource areas (MLRAs). MLRAs are geographically associated land resource units that share common characteristics related to physiography, geology, climate, water resources, soils, biological resources, and land uses (USDA, 2006). Soil survey areas typically consist of parts of one or more MLRA.

The soils and miscellaneous areas in a survey area occur in an orderly pattern that is related to the geology, landforms, relief, climate, and natural vegetation of the area. Each kind of soil and miscellaneous area is associated with a particular kind of landform or with a segment of the landform. By observing the soils and miscellaneous areas in the survey area and relating their position to specific segments of the landform, a soil scientist develops a concept, or model, of how they were formed. Thus, during mapping, this model enables the soil scientist to predict with a considerable degree of accuracy the kind of soil or miscellaneous area at a specific location on the landscape.

Commonly, individual soils on the landscape merge into one another as their characteristics gradually change. To construct an accurate soil map, however, soil scientists must determine the boundaries between the soils. They can observe only a limited number of soil profiles. Nevertheless, these observations, supplemented by an understanding of the soil-vegetation-landscape relationship, are sufficient to verify predictions of the kinds of soil in an area and to determine the boundaries.

Soil scientists recorded the characteristics of the soil profiles that they studied. They noted soil color, texture, size and shape of soil aggregates, kind and amount of rock fragments, distribution of plant roots, reaction, and other features that enable them to identify soils. After describing the soils in the survey area and determining their properties, the soil scientists assigned the soils to taxonomic classes (units). Taxonomic classes are concepts. Each taxonomic class has a set of soil characteristics with precisely defined limits. The classes are used as a basis for comparison to classify soils systematically. Soil taxonomy, the system of taxonomic classification used in the United States, is based mainly on the kind and character of soil properties and the arrangement of horizons within the profile. After the soil

scientists classified and named the soils in the survey area, they compared the individual soils with similar soils in the same taxonomic class in other areas so that they could confirm data and assemble additional data based on experience and research.

The objective of soil mapping is not to delineate pure map unit components; the objective is to separate the landscape into landforms or landform segments that have similar use and management requirements. Each map unit is defined by a unique combination of soil components and/or miscellaneous areas in predictable proportions. Some components may be highly contrasting to the other components of the map unit. The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The delineation of such landforms and landform segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, onsite investigation is needed to define and locate the soils and miscellaneous areas.

Soil scientists make many field observations in the process of producing a soil map. The frequency of observation is dependent upon several factors, including scale of mapping, intensity of mapping, design of map units, complexity of the landscape, and experience of the soil scientist. Observations are made to test and refine the soil-landscape model and predictions and to verify the classification of the soils at specific locations. Once the soil-landscape model is refined, a significantly smaller number of measurements of individual soil properties are made and recorded. These measurements may include field measurements, such as those for color, depth to bedrock, and texture, and laboratory measurements, such as those for content of sand, silt, clay, salt, and other components. Properties of each soil typically vary from one point to another across the landscape.

Observations for map unit components are aggregated to develop ranges of characteristics for the components. The aggregated values are presented. Direct measurements do not exist for every property presented for every map unit component. Values for some properties are estimated from combinations of other properties.

While a soil survey is in progress, samples of some of the soils in the area generally are collected for laboratory analyses and for engineering tests. Soil scientists interpret the data from these analyses and tests as well as the field-observed characteristics and the soil properties to determine the expected behavior of the soils under different uses. Interpretations for all of the soils are field tested through observation of the soils in different uses and under different levels of management. Some interpretations are modified to fit local conditions, and some new interpretations are developed to meet local needs. Data are assembled from other sources, such as research information, production records, and field experience of specialists. For example, data on crop yields under defined levels of management are assembled from farm records and from field or plot experiments on the same kinds of soil.

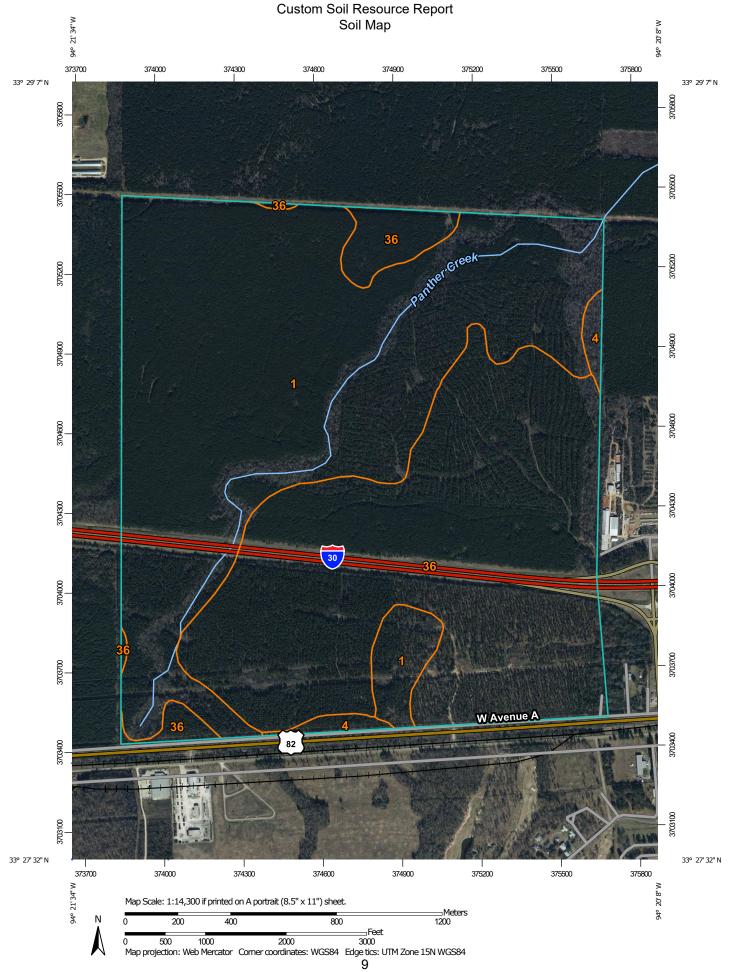

Predictions about soil behavior are based not only on soil properties but also on such variables as climate and biological activity. Soil conditions are predictable over long periods of time, but they are not predictable from year to year. For example, soil scientists can predict with a fairly high degree of accuracy that a given soil will have a high water table within certain depths in most years, but they cannot predict that a high water table will always be at a specific level in the soil on a specific date.

After soil scientists located and identified the significant natural bodies of soil in the survey area, they drew the boundaries of these bodies on aerial photographs and

identified each as a specific map unit. Aerial photographs show trees, buildings, fields, roads, and rivers, all of which help in locating boundaries accurately.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The

delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Bowie County, Texas

1—Adaton-Muskogee complex

Map Unit Setting

National map unit symbol: m9lk Elevation: 150 to 800 feet Mean annual precipitation: 42 to 52 inches Mean annual air temperature: 61 to 64 degrees F Frost-free period: 190 to 220 days Farmland classification: Not prime farmland

Map Unit Composition

Adaton and similar soils: 70 percent Muskogee and similar soils: 20 percent Minor components: 10 percent Estimates are based on observations, descriptions, and transects of the mapunit.

Description of Adaton

Setting

Landform: Stream terraces Landform position (three-dimensional): Tread Down-slope shape: Linear Across-slope shape: Linear Parent material: Loamy alluvium

Typical profile

H1 - 0 to 6 inches: silt loam H2 - 6 to 80 inches: silty clay loam

Properties and qualities

Slope: 0 to 1 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Poorly drained
Runoff class: High
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.20 in/hr)
Depth to water table: About 0 to 6 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Very high (about 12.0 inches)

Appendix V: USACE Approved Jurisdictional Determination Form

APPROVED JURISDICTIONAL DETERMINATION FORM **U.S. Army Corps of Engineers**

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): Α.

В. DISTRICT OFFICE, FILE NAME, AND NUMBER: Tulsa District

C. **PROJECT LOCATION AND BACKGROUND INFORMATION:**

State:Texas County/parish/borough: Bowie County City: New Boston Center coordinates of site (lat/long in degree decimal format): Lat. 33.472059° N, Long. -94.348465° W. Universal Transverse Mercator: 14

Name of nearest waterbody: Panther Creek

Name of nearest Traditional Navigable Water (TNW) Into which the aquatic resource flows: Red River

Name of watershed or Hydrologic Unit Code (HUC): Barkman Creek (111401060604)

Check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request.

Check if other sites (e.g., offsite mitigation sites, disposal sites, etc...) are associated with this action and are recorded on a different JD form.

D. REVIEW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY):

Office (Desk) Determination. Date:

Field Determination. Date(s):

SECTION II: SUMMARY OF FINDINGS A. RHA SECTION 10 DETERMINATION OF JURISDICTION.

There Are no "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) in the review area. [Required]

Waters subject to the ebb and flow of the tide.

Waters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce. Explain:

B. CWA SECTION 404 DETERMINATION OF JURISDICTION.

There are and are not "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area. [Required]

1. Waters of the U.S.

- a. Indicate presence of waters of U.S. in review area (check all that apply): ¹
 - TNWs, including territorial seas
 - Wetlands adjacent to TNWs
 - Relatively permanent waters² (RPWs) that flow directly or indirectly into TNWs
 - Non-RPWs that flow directly or indirectly into TNWs
 - Wetlands directly abutting RPWs that flow directly or indirectly into TNWs
 - Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs
 - Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs
 - Impoundments of jurisdictional waters
 - Isolated (interstate or intrastate) waters, including isolated wetlands
- b. Identify (estimate) size of waters of the U.S. in the review area: Non-wetland waters: linear feet: width (ft) and/or acres. Wetlands: acres.
- c. Limits (boundaries) of jurisdiction based on: 1987 Delineation Manual Elevation of established OHWM (if known):
- Non-regulated waters/wetlands (check if applicable):³ 2

Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined to be not jurisdictional. Explain: One ephemeral stream was identified on the Project.

¹ Boxes checked below shall be supported by completing the appropriate sections in Section III below.

² For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least "seasonally" (e.g., typically 3 months).

³ Supporting documentation is presented in Section III.F.

SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW:

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent":

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under *Rapanos* have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are "relatively permanent waters" (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody⁴ is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

(i) General Area Conditions:

Watershed size:	Pick List
Drainage area:	Pick List
Average annual rainfa	ll: inches
Average annual snowf	all: inches

(ii) Physical Characteristics:

(a) <u>Relationship with TNW:</u>

 ☐ Tributary flows directly into TNW.
 ☑ Tributary flows through 2 tributaries before entering TNW.

Project waters are 5-10 river miles from TNW.
Project waters are 5-10 river miles from RPW.
Project waters are 5-10 aerial (straight) miles from TNW.
Project waters are 1 (or less) aerial (straight) miles from RPW.
Project waters cross or serve as state boundaries. Explain:

Identify flow route to TNW⁵: Stream 1 flows into Panther Creek north of the Project, which flows into Barkman Creek, then the Red River. Additionally, Panther Creek flow through the Project.

⁴ Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.

⁵ Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW.

Tributary stream order, if known:

.

(b	General Tributary Characteristics (check all that apply): Tributary is: Natural Artificial (man-made). Explain: . Manipulated (man-altered). Explain: .
	Tributary properties with respect to top of bank (estimate): Average width: 3-20 feet Average depth: 1-6 feet Average side slopes: Vertical (1:1 or less).
	Primary tributary substrate composition (check all that apply): Silts Sands Cobbles Gravel Bedrock Vegetation. Type/% cover: Other. Explain: .
	Tributary condition/stability [e.g., highly eroding, sloughing banks]. Explain: Eroding with portion cutting back. Presence of run/riffle/pool complexes. Explain: Yes in both Stream 1 and Panther Creek. Tributary geometry: Meandering Tributary gradient (approximate average slope): 1 %
(c	 <u>Flow:</u> Tributary provides for: Seasonal flow Estimate average number of flow events in review area/year: 20 (or greater) Describe flow regime: Panther Creek is perennial and Stream 1 is intermittent. Other information on duration and volume: .
	Surface flow is: Discrete and confined. Characteristics:
	Subsurface flow: Unknown. Explain findings: Dye (or other) test performed: .
	Tributary has (check all that apply): □ Bed and banks □ OHWM ⁶ (check all indicators that apply): □ clear, natural line impressed on the bank □ changes in the character of soil □ shelving □ vegetation matted down, bent, or absent □ leaf litter disturbed or washed away □ sediment deposition □ water staining □ other (list): □ Discontinuous OHWM. ⁷ Explain: .
	If factors other than the OHWM were used to determine lateral extent of CWA jurisdiction (check all that apply): High Tide Line indicated by: oil or scum line along shore objects fine shell or debris deposits (foreshore) physical markings/characteristics tidal gauges other (list):
(iii) C	hemical Characteristics:

Characterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc.). Explain: Clear water except for some pools behind debris/beaver dam. Identify specific pollutants, if known:

⁶A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction (e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices). Where there is a break in the OHWM that is unrelated to the waterbody's flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break. ⁷Ibid.

(iv) Biological Characteristics. Channel supports (check all that apply):

- Riparian corridor. Characteristics (type, average width):
- Wetland fringe. Characteristics:
- Habitat for:

Federally Listed species. Explain findings:

- Fish/spawn areas. Explain findings:
- Other environmentally-sensitive species. Explain findings:

Aquatic/wildlife diversity. Explain findings:

2. Characteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW

(i) Physical Characteristics:

- (a) <u>General Wetland Characteristics:</u> Properties: Wetland size:0.43 acres Wetland type. Explain:PFO. Wetland quality. Explain: Project wetlands cross or serve as state boundaries. Explain:
- (b) <u>General Flow Relationship with Non-TNW</u>: Flow is: **Intermittent flow**. Explain:

Surface flow is: **Overland sheetflow** Characteristics:

Subsurface flow: Unknown. Explain findings: Dye (or other) test performed:

- (c) <u>Wetland Adjacency Determination with Non-TNW:</u>
 - Directly abutting
 - Not directly abutting
 - Discrete wetland hydrologic connection. Explain:
 - Ecological connection. Explain:
 - Separated by berm/barrier. Explain: 2 wetlands fed directly by streams, 1 located in the floodplain between two

streams.

 (d) <u>Proximity (Relationship) to TNW</u> Project wetlands are 5-10 river miles from TNW. Project waters are 5-10 aerial (straight) miles from TNW. Flow is from: Wetland to navigable waters. Estimate approximate location of wetland as within the 2-year or less floodplain.

(ii) Chemical Characteristics:

Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.). Explain: Water is clear. Identify specific pollutants, if known:

(iii) Biological Characteristics. Wetland supports (check all that apply):

- Riparian buffer. Characteristics (type, average width):
- Vegetation type/percent cover. Explain:
- Habitat for:
 - Federally Listed species. Explain findings:
 - Fish/spawn areas. Explain findings:
 - Other environmentally-sensitive species. Explain findings:
 - Aquatic/wildlife diversity. Explain findings:

3. Characteristics of all wetlands adjacent to the tributary (if any)

All wetland(s) being considered in the cumulative analysis: **3** Approximately (0.43) acres in total are being considered in the cumulative analysis. For each wetland, specify the following:

Directly	abuts? (Y/N)	Size (in acres)		Directly abuts? (Y/N)	Size (in acres)
Ν	0.41		Y	0.01	
Y	0.01				

Summarize overall biological, chemical and physical functions being performed:

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the *Rapanos* Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

- 1. Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D:
- 2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:
- 3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY):

- TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area:
 TNWs: linear feet width (ft), Or, acres.
 Wetlands adjacent to TNWs: acres.
- 2. <u>RPWs that flow directly or indirectly into TNWs.</u>
 - Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial: Panther Creek.
 - Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:

Provide estimates for jurisdictional waters in the review area (check all that apply):

- Tributary waters: 21,594 linear feet 4-20 width (ft). acres.
- Other non-wetland waters:
 - Identify type(s) of waters:
- 3. Non-RPWs⁸ that flow directly or indirectly into TNWs.
 - Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional waters within the review area (check all that apply):

- Tributary waters: **11,872** linear feet **3-6** width (ft). acres.
- Other non-wetland waters:
 - Identify type(s) of waters:
- Wetlands directly abutting an RPW that flow directly or indirectly into TNWs. 4.
 - Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands.
 - Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:
 - Wetlands directly abutting an RPW where tributaries typically flow "seasonally." Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:

Provide acreage estimates for jurisdictional wetlands in the review area: 0.02 acres.

- Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs. 5.
 - Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisidictional. Data supporting this conclusion is provided at Section III.C.

Provide acreage estimates for jurisdictional wetlands in the review area: 0.41 acres.

- Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs. 6.
 - Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.

Provide estimates for jurisdictional wetlands in the review area: acres.

- Impoundments of jurisdictional waters.9
 - As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional.
 - Demonstrate that impoundment was created from "waters of the U.S.," or
 - Demonstrate that water meets the criteria for one of the categories presented above (1-6), or
 - Demonstrate that water is isolated with a nexus to commerce (see E below).

- which are or could be used by interstate or foreign travelers for recreational or other purposes.
- from which fish or shellfish are or could be taken and sold in interstate or foreign commerce.
- which are or could be used for industrial purposes by industries in interstate commerce.
- Interstate isolated waters. Explain:
- Other factors. Explain:

Identify water body and summarize rationale supporting determination:

E. ISOLATED [INTERSTATE OR INTRA-STATE] WATERS, INCLUDING ISOLATED WETLANDS, THE USE, DEGRADATION OR DESTRUCTION OF WHICH COULD AFFECT INTERSTATE COMMERCE, INCLUDING ANY SUCH WATERS (CHECK ALL THAT APPLY):10

⁸See Footnote # 3.

⁹ To complete the analysis refer to the key in Section III.D.6 of the Instructional Guidebook.

¹⁰ Prior to asserting or declining CWA jurisdiction based solely on this category, Corps Districts will elevate the action to Corps and EPA HQ for review consistent with the process described in the Corps/EPA Memorandum Regarding CWA Act Jurisdiction Following Rapanos.

Provide estimates for jurisdictional waters in the review area (check all that apply):

Tributary waters: linear feet width (ft).

Other non-wetland waters: acres.

Identify type(s) of waters:

Wetlands: acres.

F. NON-JURISDICTIONAL WATERS, INCLUDING WETLANDS (CHECK ALL THAT APPLY):

- If potential wetlands were assessed within the review area, these areas did not meet the criteria in the 1987 Corps of Engineers Wetland Delineation Manual and/or appropriate Regional Supplements.
- Review area included isolated waters with no substantial nexus to interstate (or foreign) commerce.
 - Prior to the Jan 2001 Supreme Court decision in "*SWANCC*," the review area would have been regulated based <u>solely</u> on the "Migratory Bird Rule" (MBR).
 - Waters do not meet the "Significant Nexus" standard, where such a finding is required for jurisdiction. Explain:

Other: (explain, if not covered above): Stream 2 wsa considered an ephemeral stream due to a lack of flow in the days after high precipitation.

Provide acreage estimates for non-jurisdictional waters in the review area, where the <u>sole</u> potential basis of jurisdiction is the MBR factors (i.e., presence of migratory birds, presence of endangered species, use of water for irrigated agriculture), using best professional judgment (check all that apply):

- Non-wetland waters (i.e., rivers, streams): linear feet width (ft).
- Lakes/ponds: acres.

Other non-wetland waters: acres. List type of aquatic resource:

Wetlands: acres.

Provide acreage estimates for non-jurisdictional waters in the review area that do not meet the "Significant Nexus" standard, where such a finding is required for jurisdiction (check all that apply):

Non-wetland waters (i.e., rivers, streams): 2,504 linear feet, 0.5-3 width (ft).

Lakes/ponds: acres.

Other non-wetland waters: acres. List type of aquatic resource:

Wetlands: acres.

SECTION IV: DATA SOURCES.

A.	SUPI	PORTING DATA. Data reviewed for JD (check all that apply - checked items shall be included in case file and, where checked						
	and	requested, appropriately reference sources below):						
	\boxtimes	Maps, plans, plots or plat submitted by or on behalf of the applicant/consultant:						
	\boxtimes	Data sheets prepared/submitted by or on behalf of the applicant/consultant.
